

JOBU plant support rings

JOBU plant support rings: to keep them standing!

The JOBU plant support rings are practical devices to support vertically growing plants and keep their stem(s) from falling over due to wind or their own weight.

JOBU plant support rings are secured as follows:

1. Insert an appropriately sized cane in the potting soil well in advance of plant development.
2. Lower the plant support ring over the growing plant
3. Guide the stems of the plant through the open spaces of the plant support ring.
4. Raise the plant support ring as needed.

JOBU plant support rings can be used for various plants:

- **vegetable production:** For supporting pot tomatoes.
- **pot plant production:** For supporting branched plants such as Hydrangea, pot freesias, Star-of-Bethlehem, etc.
- **nursery sector:** For supporting branched plants such as garden hydrangeas.
- **perennials:** Also for use in the garden to support perennials.

**The JOBU plant support rings:
your helping hand, your plants' support!**
